Tips for Interacting with Young Learners

Young children are natural scientists. Educators can encourage scientific behaviors in children ages 0-5 by recognizing natural scientific tendencies and engaging them in developmentally appropriate ways. Approach activities as opportunities for children to investigate their world. Exposure to a scientific phenomenon, concept, or skill is very valuable for a young child, but you shouldn’t expect mastery or be too focused on very specific learning goals. You are providing the stepping-stones to later scientific understanding and skills. Consider the following approaches when working with young children.

**Interacting with a real phenomenon**
Whenever possible, engage children with science phenomena through real experiences, photos, video, and/or models. Provide physical materials that extend children’s ability to make sense of the phenomenon they are exploring.

**Connect at their level**
Kneel down so that you can make eye contact and interact with children at their level. Tell them your name and ask for theirs. Try to remark on something that might be personally interesting to the child before launching into the topic you want to discuss. For example: “I see a butterfly on your shirt. I love to watch the butterflies in the museum’s garden!” If a child seems shy, don’t force them to talk to you—let the adult caregiver take the lead.

**New experiences and skills**
Young children are experiencing many things in their world for the first time. Let them exercise and show off newly developing skills (counting or recognizing shapes). And remember, they are just developing their fine motor skills, so they may need more time for detailed tasks such as cutting, taping, or drawing.

**Non-verbal communication**
Children may not yet have the vocabulary to verbally articulate a concept, so rather than asking them to do so, encourage them to demonstrate their understanding non-verbally by manipulating the materials in front of them or by asking them to complete a task.

**Ask questions**
Ask open-ended questions and validate children’s answers by acknowledging or repeating what they say and then rephrasing it as needed. Ask questions that guide children toward comparing and making sense of observations. For example: “How did the water move when you tipped the tray?”

**Sportscasting**
Avoid non-specific praise, such as “good job!” Instead, try simply narrating (“sportscasting”) the child’s actions. This shows them that you are noticing and taking interest in their efforts, and allows them to verbally elaborate if they choose to. For example: “I see that you are pouring that water very carefully.”

**Have fun!**
A positive, playful experience will encourage learning.
Learn more about working with young children

The My Sky Tonight program from the Astronomical Society of the Pacific provides a collection of hands-on activities and educator resources for engaging pre-K children in astronomy.
